Current VLC calculated report

Calculated for the paper-equation mode; not a certificate of published-curve reproduction. The separate physical mode is documented in PHYSICAL_MODEL.md.

Eq.14 squares negative effective channels. Default energy is the nonnegative L1 interpretation of Eq.16; the printed signed sum remains opt-in.

The global bounds are independently valid and need not be jointly attainable.

Base-2 Eq. (23) gives H/h_AE=1.386294, outside Eq. (20); author clarification required.

Missing author code, SNR normalization and channel traces prevent a 100% numerical claim.

The custom baselines are not implementations of references [20], [42], [43].

See PAPER_REPRODUCTION.md and raw output_figures/fig*_data.json for assumptions and actual runs.

Simulation model	paper
Noise variance (Table I)	1.3212956342e-13
Alice-Bob electrical gain	2.7182657572e-05
Alice-Eve electrical gain	2.7182657572e-05
ZF weights	[-0.8963739 1. 1. 1.]
ZF Bob residual	-3.3881317890e-21
ZF Eve amplitude	6.6458338105e-05
ZF secrecy rate	1.6136103641 bps/Hz
ZF BER	0.0000000000e+00
Jamming cost (l1)	3.8963738953
ZF utility	0.0550608060
Global rate upper bound	1.9086544955 bps/Hz
Independent BER lower bound	0.0000000000e+00
Independent utility upper bound	1.9086544955
